

Therapeutics & Vaccines

How Vaccines Work

Vaccines "teach" your body how to defend itself when disease-causing agents (**pathogens**), such as viruses or bacteria, invade it. They help develop **immunity** by presenting **antigens** that imitate an infection. There are currently vaccines that help **protect us** against many life-threatening diseases, including meningitis and polio.

Antigens are present on all viruses and bacteria. By injecting particular antigens into the body, the immune system can safely learn to **recognize** them as hostile invaders, produce **antibodies**, and **remember** them for

 Biosynthetic vaccines contain manmade substances that are very similar to pieces of the virus or bacteria. injected

Antibody Therapies

When fighting off foreign invaders, our bodies make antibodies specifically produced for the task. A possible therapy for **COVID-19** would be the use of **monoclonal antibodies** specifically engineered to act like coronavirus-fighting immune cells.

Neutralizing antibodies bind to the virus, disabling it from attacking human body cells.
