

# PROBABILITY

## What is probability?

'or' probability.

Probability is the possibility that a certain event will occur.

An event that is certain to occur has a probability of 1. An event that cannot occur has a probability of 0. Therefore, **the probability of an event occurring is always between 0 and 1**. The closer a probability is to 1, the more certain that an event will occur. Probability is the chance of an event occurring divided by the total number of possible outcomes.

cards would be 4/52 + 4/52 = 8/52, or 2/13. These are called

• If the events overlap, it is called 'and' probability. This occurs when asked to find the probability of picking a seven **and** a heart from a standard deck of cards. The probability of picking a seven is 4/52, the probability of picking a heart is 13/52, but since there is a seven of hearts 1/52 must be subtracted.

*Example:* 4/52 + 13/52 - 1/52 = 16/52 or 4/13

• This could also be shown using a **sample space**. A sample space shows all the possible outcomes for an event. If a spinner, with the letters A-D equally spaced, is spun and a die is rolled, the probability of getting a 2 and a B could be found by using a sample space.

Sample space { A1, A2, A3, A4, A5, A6, B1, B2, B3, B4, B5, B6 }

This **tree diagram** shows that there are 6 different ways to have a snack.

Probabilities can also be found of events that are independent or dependent of each other.

#### Example:

If there are 10 marbles in a bag with 4 blue and 6 red, the probability of p or 9/2 This me doe Exa PREVIEW The 6/10 Please Sign In or Sign Up to download This ch the printable version of this worksheet othe

## Try this!

### 1. Find the following probabilities:

### 2. Write a sample space for flipping a coin and rolling a die.

### 5. In a bag there are 7 yellow marbles and 8 blue marbles.

a. Find the probability of picking 1 yellow marble and 1 blue marble with replacement.

b. Find the probability of picking 1 yellow marble and 1 blue marble without replacement.
