

Name \_\_\_\_\_ Class \_\_\_\_\_ Date \_\_\_\_\_

1 The **absolute age** of rocks is determined by analyzing the \_\_\_\_\_ in a rock.

A plant fossils  
 B number of metal ions  
 C number of silica ions  
 D radioactive isotopes

2 The absolute age of a rock is determined by **comparing** the number of unstable radioactive isotopes of a particular element in the rock with the number of stable isotopes of the same element.

Unstable isotopes break down into stable isotopes in a process called \_\_\_\_\_

A permineralization  
 B bombardment  
 C radioactive decay  
 D nuclear fusion

3 Unstable radioactive isotopes are called **parent material**. The **stable isotopes** formed from the parent material are called the **daughter material**. The amount of time it takes for 1/2 of the parent \_\_\_\_\_

4 If the **half-life** of a radioactive element is **5,730 years**, how much of the parent material exists **after 17,190 years**?

5

7 also active in the past, and that there is truly **very little geologic change** in the crust of the earth.

True or false?

A true  
 B false

**changing** the earth's landforms. He also assumed that these changes have been occurring since the beginning of earth's history.

What is the **term** we now use for Hutton's idea?

- A plagiarism  
 B catastrophism  
 C superposition  
 D uniformitarianism

9 Which of the following quotations is the famous **summary** of the theory of **uniformitarianism**?

A "The earth is 4.6 billion years old."  
 B "The past is the key to the present."  
 C "The present is the key to the past."  
 D "Uniformitarianism is not a catastrophe."

10 Compare the **layers of sediment** and the **igneous intrusion** in the picture. **Which formed first and why?**

- A the sediments; they are sedimentary  
 B the intrusion; it is igneous  
 C the sediments; the intrusion cuts across the sediments  
 D the intrusion; the sediments are broken by the intrusion
